REASON FOR ALLOWANCE

1. Whinter, and Blattner disclose various types of draft gear assembly comprising a yoke, a coupler follower positioned between the back wall of the yoke and the front end of the draft gear assembly, at least one front resilient member positioned between the coupler follower and the back wall of the yoke, at least one back resilient member positioned between the yoke back wall and the back end of the draft gear assembly, a rear follower positioned rearward of the back resilient member, a draft sill having front stops, the coupler follower having a pair of stop contact surfaces for contact with the draft sill front stops. Kaufhold et al disclose various types of draft gear assembly comprising a yoke, at least one front resilient member positioned between the coupler follower and the back wall of the yoke, a draft sill having front stops, the coupler follower having a pair of stop contact surfaces for contact with the draft sill front stops. Willison et al disclose a draft gear assembly comprising a yoke which occupy the entire draft sill, a draft sill having front stops, the coupler follower having a pair of stop contact surfaces for contact with the draft sill front stops. However, none of the references of record suggests a draft gear assembly comprising a yoke, a coupler follower positioned between the back wall of the yoke and the front end of the draft gear assembly, at least one front resilient member positioned between the coupler follower and the back wall of the yoke, at least one back resilient member positioned between the yoke back wall and the back end of the draft gear assembly, a rear follower positioned rearward of the back resilient member, a draft sill having front stops, the coupler follower having a pair of stop contact surfaces for contact with the draft sill front stops, wherein the coupler includes a

coupler bearing surface between the stop contact surfaces and at least part of coupler bearing surface being forward of the stop contact surfaces of the coupler follower in the manner defined in the instant claims 1, 17. Also, none of the references of record suggests a draft gear assembly comprising a yoke, a coupler follower positioned between the back wall of the yoke and the front end of the draft gear assembly, at least one front resilient member positioned between the coupler follower and the back wall of the yoke, at least one back resilient member positioned between the yoke back wall and the back end of the draft gear assembly, a rear follower positioned rearward of the back resilient member, a draft sill having front stops, the coupler follower having a pair of stop contact surfaces for contact with the draft sill front stops, wherein the coupler follower has generally vertical indented forward facing stop surfaces, whereby a center rod extend through the rear follower, the back resilient member and the back wall of the yoke in the manner defined in the instant claims 9, 21, and 25. Therefore, claims 2-8, 10-16, 18-20, 22-24, 26-28, depending therefrom, are considered to be allowable.
